Introduction

CUDC-907 is a dual-acting inhibitor of class I and II HDACs and class I PI3Ks with potent antitumor activity. Preclinical studies have suggested that individually targeting upstream regulators of MYC such as HDACs and PI3K can reduce MYC expression and suppress the growth of MYC-driven cancers. As HDACs and PI3K regulate MYC protein levels and functions through non-overlapping mechanisms, simultaneous HDAC and PI3K inhibition may further enhance MYC suppression. Here, we evaluate the activity and mechanism of CUDC-907 in cancer types driven by MYC upregulation.

HDAC inhibitor and PI3K inhibitor synergistically downregulate MYC and induce Caspase 3/7 activation in MYC-altered DLBCL cells

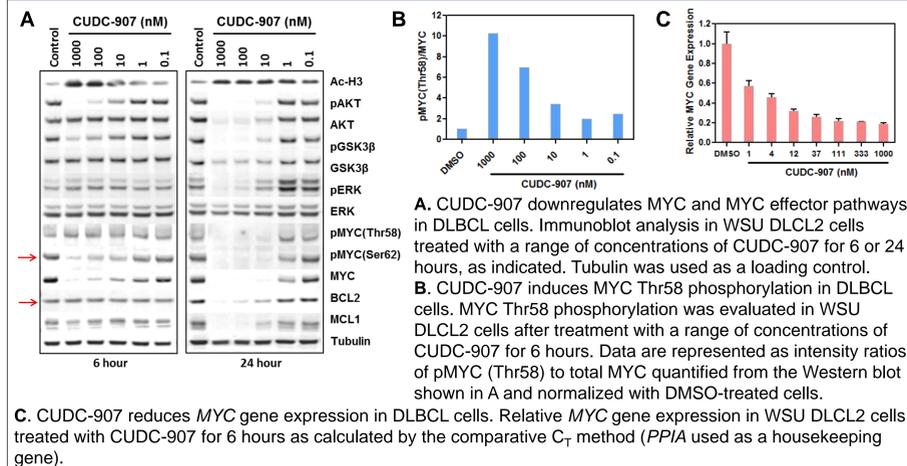

Antitumor activity of CUDC-907 in DLBCL cell lines

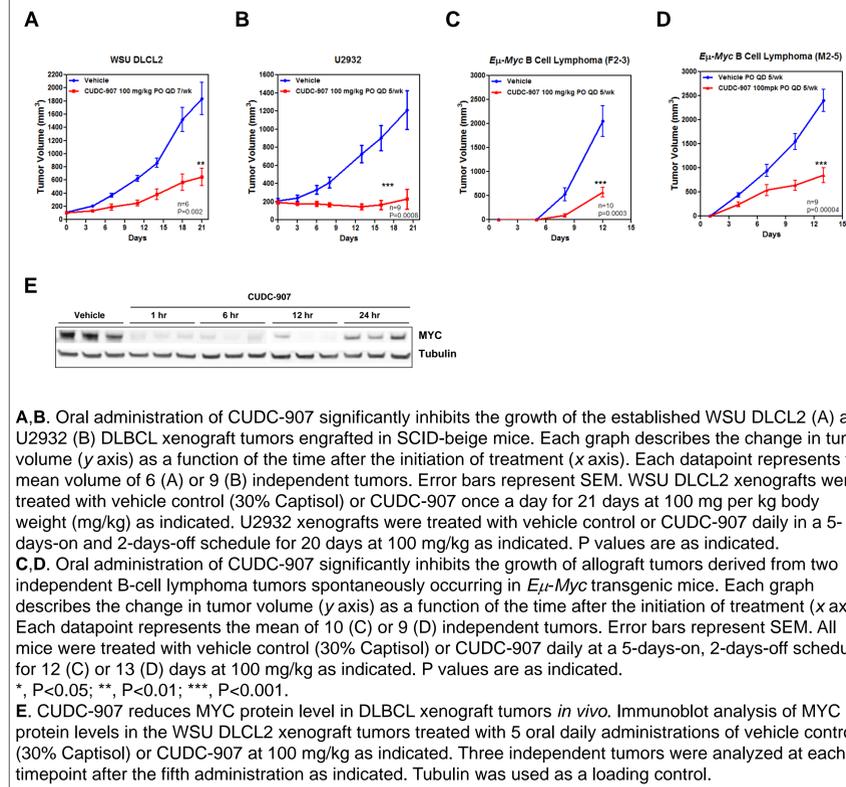

A, B. CUDC-907 inhibits growth of DLBCL cell lines. (A) Growth inhibition IC_{50} values of CUDC-907, panobinostat, or pictilisib in a panel of DLBCL cell lines. Cell viability was assessed by the CellTiter-Glo assay after 48-hour incubation with the indicated compound. The MYC status and the cell-of-origin of each cell line are indicated in the graphs. (B) Representative cell viability curves for WSU DLCL2 and U2932 cells treated with CUDC-907, panobinostat, or pictilisib. Data are normalized to DMSO-treated cells. Error bars represent SD of duplicates.

C, D. CUDC-907 induces caspase 3/7 activation in DLBCL cell lines. (C) Caspase 3/7 induction EC_{50} values for CUDC-907, panobinostat, or pictilisib in a panel of DLBCL cell lines. Caspase 3/7 activation was determined by the Caspase-Glo 3/7 assay after 24-hour incubation with the indicated compound. (D) Representative caspase 3/7 induction curves for WSU DLCL2 and U2932 cells treated with CUDC-907, panobinostat, or pictilisib. Data are normalized to DMSO-treated cells. Error bars represent SD of duplicates.

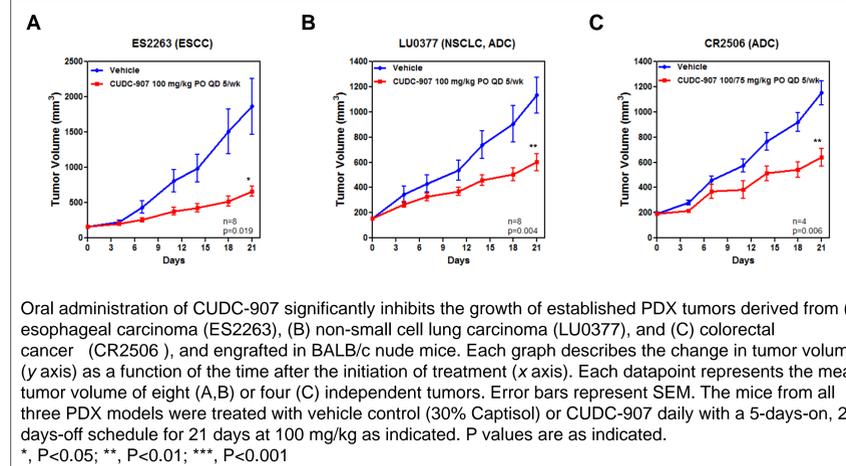

CUDC-907 induces MYC Thr58 phosphorylation and downregulates MYC in MYC-altered DLBCL cells

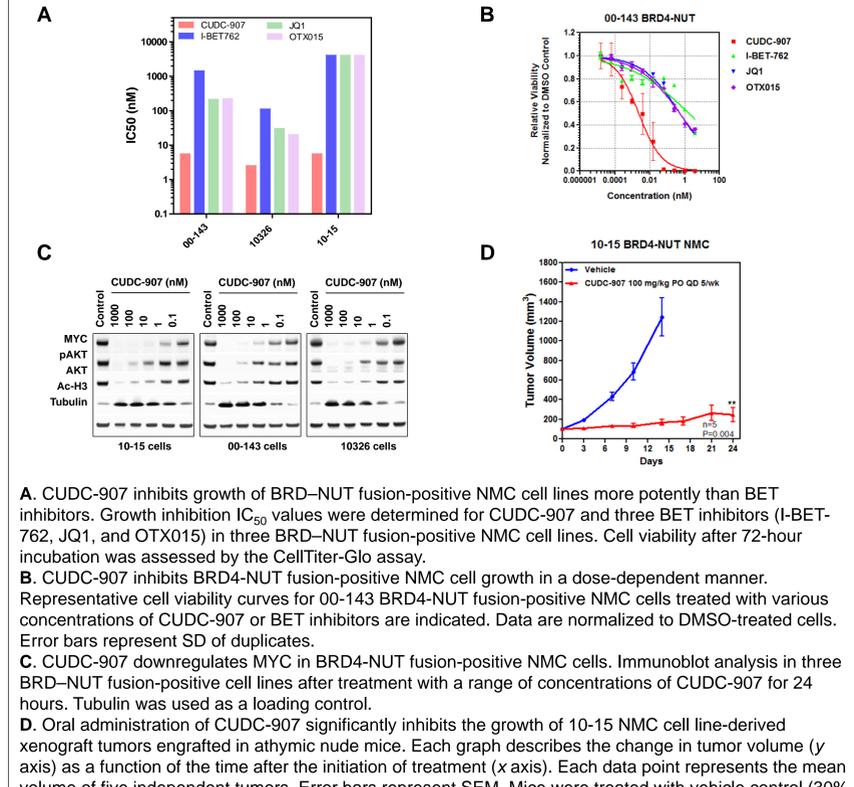

Antitumor activity of CUDC-907 in human DLBCL cell line-derived xenograft models and the *Eμ-Myc* transgenic mouse allograft models

CUDC-907 inhibits tumor growth in MYC-amplified patient-derived xenograft (PDX) models

Antitumor activity of CUDC-907 against MYC-dependent NUT midline carcinoma (NMC) cells *in vitro* and *in vivo*

Conclusions

- The combination of HDAC and PI3K inhibition synergistically downregulates MYC in diffuse large B-cell lymphoma (DLBCL) cells. This result provides a rationale of targeting MYC by simultaneously inhibiting HDAC and PI3K, two key upstream regulators of MYC with none-overlapping mechanisms
- CUDC-907, a dual-acting inhibitor of class I and II HDACs and class I PI3Ks, down-regulates MYC through decreasing MYC mRNA expression and promoting ubiquitin-proteasome mediated MYC protein degradation in the "double-hit" DLBCL cells, which has very poor prognosis. These results suggest that simultaneous inhibiting HDAC and PI3K with CUDC-907 may be an effective strategy for targeting MYC.
- Our *in vivo* results demonstrate that CUDC-907 effectively inhibits the growth of MYC-driven tumors representing multiple cancer types, including "double hit" DLBCL xenograft models, MYC-dependent NUT midline carcinoma (NMC) xenograft models, *Eμ-Myc* transgenic allograft models of B-cell lymphoma, and MYC-amplified solid tumor PDX models. These results suggest the potential of using CUDC-907 as treatment strategy for MYC-dependent cancers across indications.
